PROJECT

ARRIVAL DELAY PREDICTION IN FREIGHT RAIL OPERATIONS

This study presents a comprehensive approach to predicting freight rail arrival delay times, as well as investigating the underlying causes of delays and their expected impact on operations. The goal is to predict operational delays in real time and to create a STDSS that will assist decision-makers in future operational interventions to reduce disruptions and the resulting delays in freight operations. This will improve railway reliability in the freight transport sector in the long run. Previous studies have developed models that predict the occurrence of disruptions or delay times in railway operations, but most of them have focused on passenger trains. Freight train research has primarily focused on examining the impact of network delays rather than train delays and has been unable to predict short-term delay times once the train has departed from the previous control station.
